

# Adding a new Area field Documentation

Under the div of (updateEvent and addEvent)  
you will see the Area field like the below code

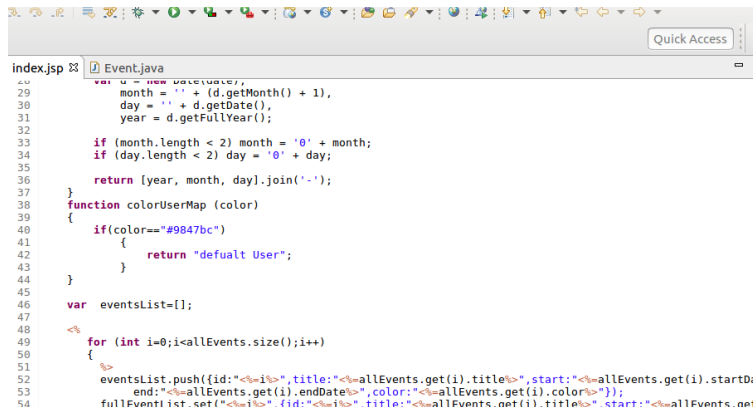

```
<label>Area :</label>
<select id="eventAddArea" >
  <option value=""selected disabled hidden>please select an option</option>
  <option value="#9847bc">default User</option>
</select>
```

to add a new field add a line like the below

```
<option value="#9847bc">default User</option>
<option value="The color of the field">The name of the field</option>
```

make sure that you add the line in both of `eventAddArea` and `eventEditArea`.

After adding the lines in the html part we have to add it in the js

In the function called colorUserMap in the beginning of the jsp  
**function** colorUserMap (color)

```
{
  if(color=="#9847bc")
  {
    return "default User";
  }
}
```

add an if condition like the below

```
if(color=="#9847bc")
{
  return "default User";
}
```

```
if(color=="The color of the field")
{
    return "The name of the field";
}
```

make sure you write it exactly like the html fields
